

# SciFi reconstruction and alignment

Nils Breer + SciFi alignment + calibration team
2. Juni 2023

SciFi general at 108th LHCb week - 5th june 2023

### **Reconstruction and alignment overview**

- SciFi simulation and reconstruction
  - Weekly group meetings: Monday, 13:00h
  - Mailing list: lhcb-upgrade-ft-software
  - Twiki
- Updates since last LHCb week
  - Alignment:
    - published Alignment v10
    - new and improved photogrammetry taken
    - readout map improved

•

#### People working with SciFi align and calibration

- Blake Leverington
- Fred Blanc
- Izaac Sanderswood
- Maria Vieites Diaz
- Zehua Xu
- Jessy Daniel
- · Louis Henry
- Emmy Gabriel
- Sophie Hollitt
- Biljana Mitreska
- Miguel Ruiz Diaz
- Giulia Tuci

#### People from different projects

• Laurent Dufour

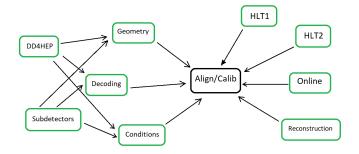

# **Overview of the topics**

N.Breer | 2. Juni 2023 3 / 16

# **Readoup Map adaptations**

Readout map →Cabling Map automatic fetching of deactivated links →deactivate links without changing readout map! 2022: no active link map →empty events LHCb!4129 improved flexibility

2023: allows to ignore dynamic link deactivation if no active link found

N.Breer | 2. Juni 2023 4 / 16

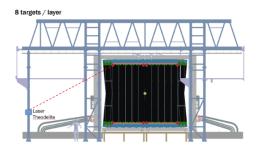

### **Survey and Photogrammetry**

- photogrammetry taken: feb 20th march 9th
- 4 measurement points per C-frame at corners
- target: keep inner modules as close to nominal as possible, outer edges can move as needed
- summary: 450 microns in z, most frames within 200 microns from nominal
- 400 microns in x, 1.5 mm in y
- on average 400 600 microns in y, 50 200 microns in the center

N.Breer | 2. Juni 2023 5 / 16

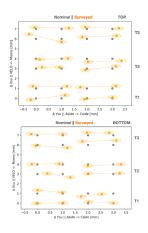

### **Photogrammetry**

- top/bottom view of the respective edges ±2.5*m* above/below beam pipe
- 200 µm survey uncertainty
- A-side →+x, C-side →-x
- $\bullet$  T1, T2: outer layers surveyed  $\rightarrow$ L0 and L3

N.Breer | 2. Juni 2023 6 / 16

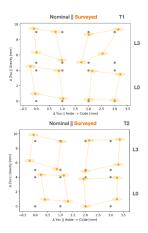

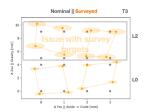

## **Survey and Photogrammetry**

- T3: L0 and L2 surveyed (L3 targets in RICH volume)
- T3L2 measured between L1 and L2 with smaller targets
- possible movement during measurement

N.Breer | 2. Juni 2023 7/16

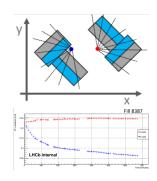

#### **VELO drift situation**

- The situation:
- Monitoring, alignment and material scan are consistent
- During closing, C-side starts rotating around y with pivot point at around 850 mm
- →upstream region lacks behind
- complications:
  - start of drift unpredictable
  - drift amount differs over time

N.Breer | 2. Juni 2023 8 / 16

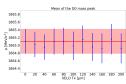

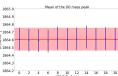

#### **VELO drift impact for SciFi alignment**

- Goal: estimate impact of VELO movement on reconstructed mass
- DoFs: Tx, Rz long modules aligned, GoodLongTracks
- ullet data set:  $B_0 o D^*\pi$  and  $D_0 o K\pi$

N.Breer | 2. Juni 2023 9 / 16

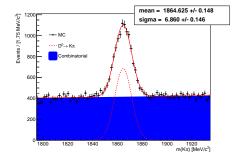

# **VELO drift impact for SciFi alignment**

- **Ry** shows no impact on SciFi alignment and mass distribution
- mass peak slightly affected for drifts below  $20\mu m$
- large movements impact on mass resolution visibly
- alignment with VELO drift also negatively impacts resolution slightly

N.Breer | 2. Juni 2023 10 / 16

#### SciFi alignment with 2022 data

# 2022 alignment "version flow"

Initial positions from survey+photogrammetry

Modules TxRz align (long tracks)

SciFi v1

Correct beam angle in survey Improvements to timing

Modules TxRz align (long tracks)

Cross check of VELO drift effect size

Diagnose low efficiency: T2X2 C side starting position Ability to run in DD4HEP/master

Mat adjustment needed to correct for SiPM position Module continuity constraint?

Loose track matching/params on iteration 0-2?

halflayers+ Modules TxRzTz align (long track<u>s + D0 particle)</u> + Tx Mat alignment

SciFi v3

- half modules yield better performance than long modules
- why? becasue if starting conditions not guite correct, half modules can correct it better
- beam angle fix + better fine timing
- VELO z-drift studies (later in the talk)
- discovered low efficiency C-side
- →improved starting conditions
- mats need to correct for SiPM positions
- loose track matching/params in first nance boost 11/16

N Breer | 2 Juni 2023

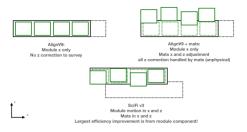

#### SciFi Mats: from v9 to v10

#### How do module/mat alignments work together?

- v9 featured no z correction in survey and shifting of whole module in x
- v9 + mats: SiPMs being aligned and not glued mats
- →still unphysical movement out of the module
- v10: modules movement in x and z allows for physical 'mat movement'
- yield: largest efficiency improvement from module alignment but mats needed

N.Breer | 2. Juni 2023 12 / 16

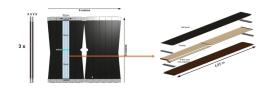

## **Mat alignment**

#### from Zehua's slides

- real mats glued together with fine tolerance
- but preliminary mat alignment sees movement up to 1.5mm
- Mat alignment: moving mats in software to match best hit position in tracking
  - depends on module alignment quality
  - depends on relative position of glued SiPM readout relativ to mats

N.Breer | 2. Juni 2023

#### **Summary**

#### →Goal:

- correct for hit positions in readout without moving mat material in simulation
- understand rotations in survey positions that may produce z movement in reco
- understand true variations in SiPM positions

N.Breer | 2. Juni 2023 14 / 16

## **Monitoring**

N.Breer | 2. Juni 2023 15 / 16

#### **Cluster bias**

N.Breer | 2. Juni 2023
